

- CLAIM -

What is claimed is:

1) A trach tube sensory alert mechanism that comprises:

an alarm system with a temperature sensor which is positioned
5 within the tracheotomy tube of a patient that is inserted into the
windpipe area and which is configured to emit an audible alert
alarm when the temperature detected by the sensor falls below a
predetermined set temperature to alert the patient care givers that
the trach tube may have been pulled out or a drastic drop in body
10 temperature has occurred.
